SUMMARY

The South River Bridge Mitigation Site is located on the Cumberland/Sampson County line. The site was planted in December 2003 and was designed as mitigation for wetland impacts associated with bridge project B-3152.

The mitigation encompasses approximately 0.25 acres total of wetland restoration. The restoration effort involved the removal of the temporary detour and monitoring the area to ensure that it re-attains wetland jurisdictional status. No hydrologic monitoring is required for this project; however, vegetation monitoring is required for three years.

After the first year of monitoring, the South River Bridge site shows by visual observation that the planted species are surviving and that the impacted area is re-attaining jurisdictional status.

NCDOT recommends continuing vegetation monitoring of this site.

1.0 INTRODUCTION

1.1 Project Description

The South River Bridge Mitigation Site is located at Bridge No. 46 on NC 242 on the Cumberland/Sampson County line (Figure 1). The site consists of approximately 0.25 acres of mitigation for wetland impacts associated with project B-3152.

1.2 Purpose

In order for a mitigation site to be considered successful, a site must meet vegetation success criteria. This report details the vegetation monitoring in 2004 at the South River Bridge Mitigation Site. Hydrologic monitoring was not required for the site.

1.3 Project History

December 2003	Site planted
August 2004	Vegetation Monitoring (1 year)

2.0 VEGETATION: SOUTH RIVER BRIDGE MITIGATION SITE (YEAR 1 MONITORING)

2.1 Success Criteria

Success Criteria states that the impacted area where the onsite detour was removed shall be replanted using native species and must re-attain jurisdictional status at the end of three years.

2.2 Description of Species

The following wetland species were planted in the Wetland Restoration Area:

Taxodium distichum, Baldcypress

Fraxinus pennsylvanica, Green Ash

Quercus phellos, Willow Oak

Quercus lyrata, Overcup Oak

Nyssa sylvatica var. *biflora*, Swamp Blackgum

2.3 Results of Vegetation Monitoring

The impacted area where the onsite temporary detour was removed and revegetated is re-attaining jurisdictional status and the planted species are surviving.

Site Notes: Other species noted include: fennel, goldenrod, smartweed, ragweed, and various grasses.

2.4 Conclusions

There were approximately 0.25 acres of wetland restoration planted on site. There were no plots established on the site. By visual observation the South River Bridge site shows that the planted species are surviving and that the impacted area is re-attaining jurisdictional status.

3.0 Overall Conclusions and Recommendations

NCDOT will continue vegetation monitoring at the South River Bridge Site.
